

Before you can capture footage, what is the first thing you must do?

You must connect your source device via a FireWire cable or third-party capture card.

Marking clips for capture is similar to marking clips while editing. True or false?

True.

You can enter a variety of clip information in the Logging tab. Give an example of logging information that appears in the Browser columns.

Log note, good take, scene number, take number, angle number, clip name.

When you choose a capture preset, what settings do you want it to match?

Your source footage settings. If you have a variety of footage, it should match whatever format represents the majority of clips or the highest quality, depending upon the project and your hardware.

What are the 3 capture modes you can use to capture footage?

Capture Clip, Capture Now, and Batch Capture

What is a scratch disk?

The target destination for your capture media files.

How can you save time using the Batch Capture mode?

With the Batch Capture mode, you can log individual clips then capture them together at the same time.

Where do you modify your logged clip settings?

Modify logged clip settings in the Modify Clip Settings dialog, which you access from the Modify menu.

You can choose only your computer hard drive as a scratch disk. True or false?

False. You can set your computer hard drive or an external FireWire drive as your scratch disk, where the media files will be saved.

What other settings window contains the scratch disk information like that on the Capture Settings tab?

The System Settings window.

What other settings window contains the device control information like that on the Capture Settings tab?

The Audio/Video Settings window.
